

General

This system can be used to record and play back video with internet, intranet, WLAN tai GPRS-yhteyksiä. Transferred data can be encrypted.

Recording

Video compression unit can also be configured to record video digitally. Video recording can be continuous or it can be triggered by motion detection. Recording capacity can vary from 24 hours to tens several weeks depending on the configuration. User can configure the recorded image quality and frame rate separately from the transmitted image quality and available bandwidth.

User interface

Video is decompressed and played back in normal Windows PC with VideoPlayer application. No additional hardware is needed for decompression (codecs etc.).

On VideoPlayer application user selects the camera, which video or recordings she/he wants to see.

VideoPlayer application is also available for PDA. With PDA user can view video from the video compression unit using GPRS, WLAN or Ethernet connection.
